Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

opacity protein opaB - Neisseria meningitidis (isolate 21213) (fragment)
C;Species: Neisseria meningitidis
A;Variety; isolate 21213
C;Date: 13-Jan-1995 #sequence_revision 24-Oct-1997 #text_change 09-Jul-2004
C;Accession: 844709
C;Accession: 844709
Mol. Microbiol. 12, 171-180, 1994
A;Title: Microevolution within a clonal population of pathogenic bacteria: recombination A;Reference number: 844705; MUID:94335637; PMID:7520117
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          A;Cross-references: UNIPROT:051089; EMBL:U03409; NID:g432174; PIDN:AAA61550.1; PID:g4321 A;Experimental source: isolate Z1213; strain serogroup A; clone pFLOB2510 A;Note: expression of opacity proteins is regulated by the number of translated repeat e of repeats place the start codon in frame with the rest of the protein

Nucleotide sequences that hybridise to huRAD cDNA - method for isolating human checkpoint cDNA, and antibody to CDC34.

Example 4; Col 89-96; 73pp; English.

This sequence is the yeast MEC2 protein. The DNA encoding this sequence is necessary for \$2/M cell cycle checkpoint control. This sequence was identified using the method of the invention for isolating a human checkpoint cDNA that is capable of restoring growth at a restrictive temperature in a yeast test cell, where the yeast test cell comprises a genome having a first gene that forms a DNA strand break at a restrictive temperature and a second gene that fails to induce a cell cycle arrest in response to the DNA strand break, whereby the growth of the yeast test

Proteins of the invention and DNA sequences encoding them are given in records ABR52588-ABR53903 and ACC60610-ACC61944 respectively. The complexes are obtainable by using a protein as a bait and isolating the set of proteins which is attached thereto from cells. Such protein complexes may comprise up to 30 distinct proteins. Protein complexes of the invention are useful
The present sequence is the protein sequence of Saccharomyces cerevisiae PSFX1, a protein related to human tyrosine throomine kinase (TTK, see ABP54938). TTK polymucleotides and polypeptides of the invention encompass polymucleotides and polypeptides having sequence similarity or encompass polymucleotides and polypeptides having sequence similarity or the invention is based on the finding that TTK is differentially expressed in various forms of cancer. It provides methods for the identification of cancerous sells, especially heast cancer and colon cancer cells, by detection of expression levels of TTK, se well as diagnostic, prognostic and therapeutic methods. These methods can be used as the basis of tational tharapy. Assays for identifying molecules that modulate the activity of these genes in cancers, as well as methods of inhibiting tumour growth by inhibiting the activity of TTK are also
                                                                                                                                                                                                                                                                              66 WIFGRNPACDYHLGNISRLSNKHFQILLGEDGNLLLNDISTWGTWLNGQKVEKNSNQLLS 125

The invention relates to detecting cancer (other than ovarian cancer) in a subject, comprising comparing the expression levels of tyrosine threonine kinase (TTK, a mitotic checkpoint game) polypeptide or polynucleotide in a test cell obtained from the subject and in a normal non-cancer cell, where an increase in the expression level of TTK protein or nucleic acid in the test cell compared to that in the normal cell, indicates the presence of cancer other than ovarian cancer. Also included are reducing growth of a cancerous cell (by contacting a cancerous cell with an amount of an agent effective to reduce TTK polypeptide activity in the cell), an assay for identifying a candidate agent that reduces growth of a cancerous cell (comprising: (i) detecting the activity of a TTK polypeptide in the presence of a candidate agent; and (ii) comparing
for diagnosing a disease or disorder, or as a target for an active agent of a pharmaceutical, preferably a drug target in the treatment or prevention of a disease or disorder. Note: The sequence data for this patent is not represented in the printed specification, but is based on sequence information supplied by the European Patent Office. the activity of TTK polypeptide in the presence of a candidate agent relative to TTK polypeptide activity in the absence of the candidate agent, identifying an agent that reduces TTK activity (comprising: (i) contacting a cancerous cell displaying elevated expression of a TTK-encoding polynucleotide with a candidate agent; and (ii) determining the effect of the candidate agent on TTK polypeptide activity) and assessing the prognosis of a cancerous disease other than owarian cancer in a subject (comprising: (i) detecting expression of TTK-encoding polynucleotide in the test cancer cell of expression of TTK-encoding polynucleotide in the test cancer cell with a level of expression of the polynucleotide in the test cancer cell with a level of expression of TTK in the test cancer cell where the level of expression of TTK in the test cancer cell is indicative to the prognosis of the cancerous disease). The methods are useful for detecting cancer (other than ovarian cancer) in a subject, cancing growth of cancerous cells, identifying a candidate agent that reduces TTK activity and assessing the prognosis of a cancerous disease other than covarian cancer. The methods are also useful for determining the ability of a subject to respond to a particular therapy e.g. as a basis of rational therapy. The present sequence represents a closely related to protein to human TTK, in this case yeast SPKI (not defined)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            1 WTFGRNPACDYHLGNISRLSNKHFQI-LXXXXXXLLNDISTNGTWLNGQKVEKNSNQLLS 59

The invention relates to novel protein complexes comprising a first and a second protein, or its derivative, fragment, homologue or variant. The proteins are selected from given protein complexes, which are not defined in the specification. The variants are encoded by nucleic acids that hybridize to the nucleic acids encoding the proteins under low stringency conditions. The protein complexes are useful as targets for an active agent of a pharmaceutical. These protein complexes are particularly useful as drugs targets for the treatment or preventing of a disease or disorder. The complexes and methods above are useful in diagnosing or screening for the presence of a disease or disorder or a predisposition for developing a disease or disorder in a subject. These are also useful in screening for a drug for treatment or prevention of a disease or disorder. The molecule that modulates the amount, activity or protein components of the complex is useful for the manufacture of a medicament or prevention of a disease or disorder. This sequence corresponds to a protein of the invention. (Note: the sequence data for this patent did not form part of the printed specification but was obtained from the EPO in electronic format).

The invention relates to constructing (M1) a strain of diploid fungal cells in which both alleles of a gene are modified, comprising modifying one allele by insertion or replacement by a cassette having an expressible selectable marker and modifying other allele by recombination, of a promoter replacement fragment with a heterologous promoter, so that expression of the second allele is regulated by the promoter. (M1) is useful for constructing a strain of diploid fungal cells in which both alleles of a gene are modified. The diploid fungal cells having both alleles modified are useful for identifying a gene that is essential to the survival or growth of a fungus, a gene that contributes to the virulence and/or pathogenicity of a fungus, a gene
The present sequence is a protein which is essential for the survival and growth of Candida albicans. This fungus causes infection, such as vulvovaginitis, in humans, particularly in those who are immunocompromised. The protein and its gene can be used to diagnose infection, and they can be used as targets for inhibiting the proliferation of the fungus. This protein and gene are particularly useful as they are thought to be species-specific
                                                                                                                                                                                                                                                                                           Constructing strains for identifying gene products as effective targets for therapeutic intervention, by inactivating in the strain one allele of a gene and placing other allele of the gene under conditional expression
                                                                                                                                                                                                                                                                   1 WIFGRNPACDYHLGNISRLSNKHFQI-LXXXXXXL-LNDISTNGTWLNGQKVEKNSNQLL

```
agent, an antifungal agent that inhibits the growth of a diploid fungus and for identifying a therapeutic agent for treatment of a mammalian disease. (M1) is useful for identifying a compound which modulates the activity of a gene product, preferably enzymatic activity, carbon compound catabolism, blosynthetic, transporter, transcriptional, translational, signal transduction, DNA replication and cell division activity. The method is useful for identifying a compound having the ability to inhibit growth or proliferation of C. albicans cells and for treating infection by C. albicans. The present sequence is that of an essential candida albicans protein used in the method of the invention. Note: The sequence data for this patent is not represented in the printed specification but is based on sequence information supplied to Derwent by the European Patent Office
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New recombinant DNA construct comprising a promoter positioned to provide for expression of a polynucleotide encoding a polypeptide from a microbial source, useful for producing plants with improved properties.
                                                                                                                                                                                                                                                                                                                                                                             28
to the resistance of a diploid fungus to an antifungal
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 cold tolerance, heat tolerance; drought tolerance; herbicide, osmosis; pathogen tolerance; pest tolerance; plant disease resistance; cell cycle pathway modification; plant growth regulator; homologous recombination; seed oil yield; protein yield; carbohydrate; nitrogen; phosphorus; photosynthesis; lignin; galactomannan; bacterial polypeptide.

The invention relates to a recombinant DNA construct comprising a promoter functional in a plant cell, where the promoter is positioned to provide for expression of a polynucleotide encoding a polypeptide from a microbial source. The invention also relates to a transformed plant comprising the recombinant DNA construct and a method of producing a transformed plant as a crop plant such as maize or soybean. The method of producing a transformed plant the such as maize or soybean. The method of producing a plant is a crop plant such as maize or soybean. The method of producing a plant with the recombinant DNA construct and growing the transformed plant, where the polynucleotide or polypeptide is useful for improving plant properties. The recombinant DNA construct is useful for improving plant properties. The recombinant properties, e.g. improved cold, heat or drought tolerance, tolerance to herbicides, extreme osmotic conditions, pathogens or pests, increased resistance to plant disease, better growth rate by modification of combodydrate, nitrogen or phosphorus use and/or property modification of carbohydrate, nitrogen or property plant property and plant growth regulators, increased rate of content, improved ylath by modification of carbohydrate, nitrogen or property property and plant property plant growth regulators, increased rate of content, improved ylath by modification of carbohydrate, nitrogen or property property and plant property plant plant property plant property plant plant property plant property plant p
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             providing improved plant growth and development under at least one giress condition, improved lignin production or improved galactomannan production. This sequence represents a bacterial polypeptide used in the scope of the invention. Note: The sequence data for this patent did not form part of the printed specification but was obtained in electronic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |:|||:||

promoter functional in a plant cell, where the promoter comprising a microbial source. The invention also relates to a transformed plant comprising the recombinant bNA construct and a method of producing a comprising the recombinant bNA construct and a method of producing a transformed plant having an improved property. The plant is a crop plant source or soybean. The method of producing a transformed plant having an improved property comprises transformed plant, where the having an improved property comprises transformed plant, where the recombinant bNA construct and growing the transformed plant properties. The recombinant bNA construct is useful for improving plants with the polynucleotide or polypeptide is useful for producing plants with improved plant properties, e.g. improved cold, heat or drought tolerance, colerance to herbicides, extreme semble conditions, pathogens or pests, increased resistance to plant disease, better growth rate by modification of the cell cycle pathway with plant growth regulators, increased rate of homologous recombination, modified seed oil or protein yield and/or content, improved plant growth and development under at least one stress condition, improved light production or improved galactomannan production or improved algain production or improved galactomannan production or improved the represents a bacterial polypeptide used in the production. This sequence represents a bacterial polypeptide used in the
                                                                                                                                                                                                                New recombinant DNA construct comprising a promoter positioned to provide for expression of a polynucleotide encoding a polypeptide from a microbial source, useful for producing plants with improved properties.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                78 GRSNTCNYQLLQFT-ASYKHFRVYSVLIDDDMDPLVYCEDQSSNGTFLNHRLIGKGNSVL 136

                                                                                                                                                                                                                                          The invention relates to Pseudomonas aeruginosa polypeptides and the polynucleotides encoding them. The sequences are useful in diagnosis and theraphological conditions, as molecular targets for diagnostics, prophylaxis and treatment of pathological conditions resulting from a companylaxis and treatment of pathological conditions resulting from a companylaxis and treatment of pathological conditions resulting from a companylaxis and treatment of pathological conditions as components of correction infection, for evaluating a compound, such as a polypeptide, confection of P. aeruginosa nucleic acid, as components of production of P. aeruginosa sequences or polypeptides, as target components for diagnosis and/or treatment of P. aeruginosa sequences or other sequences infection, and in detection of P. aeruginosa sequences or other sequences of Pseudomonas species using biochip technology. Sequences or other sequences of Pseudomonas species using biochip technology. Sequence data for this patent did not form part of the printed sequence data for this patent did not form part of the printed specification but, was obtained in electronic format from USPTO at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    92 TIGRGPDNDWVLPDPERLVSSRHCTILNRDGVYYLTDTSTNGVLVNAGHRLRRGNSEPL 151

The invention relates to isolated nucleic acid molecules and their encoded secreted proteins. The nucleic acids and proteins are used to encoded secreted proteins. The nucleic acids and proteins are used to revenit treat or ameliorate a medical condition in e.g. humans, mice, rabbits, goats, horses, cats, dogs, chickens or sheep. They are also used in diagnosing a pathological condition or susceptibility to a also used in alleviating symptoms associated with the disorders and in diagnostic immunoassays e.g. radioimmunoassays or enzyme linked immunosorbant assays (EILSA). Disorders which are diagnosed or treated include autoimmune diseases e.g. rheumatoid arthritis, hypotroliferative disorders e.g. cardiac carest, cerebrovascular disorders e.g. cherebral ischaemia, analyceneeis, nervous system disorders e.g. Alzheimer's disorders e.g. corneal infection, bacteria, viruses and fungi and ocular disorders e.g. corneal infection, con many other disorders listed in the specification. The polypeptides can also be used to aid wound healing and epithelial cell proliferation, to prevent skin aging due to sunburn, to maintain organs before capabilities, for supporting cell culture of primary tissues, to regenerate tissues and in chemotaxis. The polypeptides can also be used as a food additive or preservative to increase or decrease storage capabilities, fat content, lipid, protein, carbohydrate, vitamins, minerals, coffactors and other nutritional components. The present sequence represente a novel secreted protein of the invention. Note: The sequence data for this patent did not form part of the printed
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 1 WTFGRNPACDYHLGNISRLSNKHFQIL--XXXXXXLLNDISTNGTWLNGQKVEKNSNQLL 58
